## Balanced Equations

Question Paper

Time available: 65 minutes Marks available: 57 marks

1. Calcium sulfide reacts with calcium sulfate as shown.

$$
\mathrm{CaS}+3 \mathrm{CaSO}_{4} \rightarrow 4 \mathrm{CaO}+4 \mathrm{SO}_{2}
$$

2.50 g of calcium sulfide are heated with 9.85 g of calcium sulfate until there is no further reaction.

Show that calcium sulfate is the limiting reagent in this reaction.
Calculate the mass, in g , of sulfur dioxide formed.
$M_{r}(\mathrm{CaS})=72.2$
$M_{r}\left(\mathrm{CaSO}_{4}\right)=136.2$
$\qquad$
2. A student is provided with a 5.60 g sample of ethanoic acid $\left(\mathrm{CH}_{3} \mathrm{COOH}\right)$ contaminated with sodium ethanoate $\left(\mathrm{CH}_{3} \mathrm{COONa}\right)$.

The student dissolves the sample in deionised water and makes the volume up to $200 \mathrm{~cm}^{3}$
The student removes $25.0 \mathrm{~cm}^{3}$ samples of the solution and titrates them with $0.350 \mathrm{~mol} \mathrm{dm}^{-3}$ sodium hydroxide solution.

The table below shows the results of these titrations.

|  | Rough | 1 | 2 | 3 |
| :--- | :---: | :---: | :---: | :---: |
| Final volume $/ \mathrm{cm}^{3}$ | 20.85 | 41.10 | 20.50 | 40.80 |
| Initial volume $/ \mathrm{cm}^{3}$ | 0.00 | 20.85 | 0.00 | 20.50 |
| Titre $/ \mathrm{cm}^{3}$ | 20.85 | 20.25 | 20.50 | 20.30 |

(a) Use the results in the table above to calculate the mean titre value.

Use the mean titre to calculate the percentage by mass of sodium ethanoate in the original sample.

Mean titre value $\qquad$ $\mathrm{cm}^{3}$
$\qquad$
(b) The student rinses the burette with deionised water before filling with sodium hydroxide solution.

State and explain the effect, if any, that this rinsing will have on the value of the titre.
$\qquad$
$\qquad$
$\qquad$
$\qquad$
3. A student investigates two experimental methods of making methylpropanal. The equations for these two methods are shown.

Method 1

## Method 2

In each method, the student uses 1.00 g of organic starting material.
The yield of methylpropanal obtained using each method and other data are included in the table.

|  | Method 1 | Method 2 |
| :--- | :---: | :---: |
| Yield of methylpropanal / mg | 552 | 778 |
| Percentage yield |  | $80.0 \%$ |
| Percentage atom economy | $62.1 \%$ |  |

Calculate the percentage yield for Method 1.
Calculate the percentage atom economy for Method 2.

State the importance of percentage yield and percentage atom economy when choosing the method used to make a compound.
$\qquad$
\% yield
Importance of percentage yield $\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
\% atom economy $\qquad$
Importance of percentage atom economy $\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
(Total 6 marks)
4. A student does an experiment to determine the percentage by mass of sodium chlorate(I),
NaCIO, in a sample of bleach solution.

Method:

- Dilute a $10.0 \mathrm{~cm}^{3}$ sample of bleach solution to $100 \mathrm{~cm}^{3}$ with distilled water.
- Transfer $25.0 \mathrm{~cm}^{3}$ of the diluted bleach solution to a conical flask and acidify using sulfuric acid.
- Add excess potassium iodide to the conical flask to form a brown solution containing $\mathrm{I}_{2}(\mathrm{aq})$.
- Add $0.100 \mathrm{~mol} \mathrm{dm}^{-3}$ sodium thiosulfate solution $\left(\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}\right)$ to the conical flask from a burette until the brown solution containing $\mathrm{I}_{2}(\mathrm{aq})$ becomes a colourless solution containing $I^{-}(\mathrm{aq})$.

The student uses $33.50 \mathrm{~cm}^{3}$ of sodium thiosulfate solution.
The density of the original bleach solution is $1.20 \mathrm{~g} \mathrm{~cm}^{-3}$
The equations for the reactions in this experiment are

$$
\begin{gathered}
\mathrm{ClO}^{-}(\mathrm{aq})+2 \mathrm{H}^{+}(\mathrm{aq})+2 \mathrm{I}^{-}(\mathrm{aq}) \rightarrow \mathrm{Cl}^{-}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{I})+\mathrm{I}_{2}(\mathrm{aq}) \\
2 \mathrm{~S}_{2} \mathrm{O}_{3}{ }^{2-}(\mathrm{aq})+\mathrm{I}_{2}(\mathrm{aq}) \rightarrow 2 \mathrm{I}^{-}(\mathrm{aq})+\mathrm{S}_{4} \mathrm{O}_{6}{ }^{2-}(\mathrm{aq})
\end{gathered}
$$

(a) Use all the information given to calculate the percentage by mass of NaClO in the original bleach solution.

Give your answer to 3 significant figures.
$\qquad$
(b) The total uncertainty from two readings and an end point error in using a burette is $\pm 0.15 \mathrm{~cm}^{3}$

What is the total percentage uncertainty in using the burette in this experiment?
Tick ( $\sqrt{ }$ ) one box.
0.45\%
0.90\%
1.34\%

5. A student does an investigation to determine the relative formula mass, $M_{\mathrm{r}}$, of a solid unknown diprotic acid, $\mathrm{H}_{2} \mathrm{~A}$

$$
\mathrm{H}_{2} \mathrm{~A}+2 \mathrm{NaOH} \rightarrow \mathrm{Na}_{2} \mathrm{~A}+2 \mathrm{H}_{2} \mathrm{O}
$$

- $\quad 250 \mathrm{~cm}^{3}$ of aqueous solution are prepared using 1300 mg of $\mathrm{H}_{2} \mathrm{~A}$
- A pipette is used to add $25.0 \mathrm{~cm}^{3}$ of $0.112 \mathrm{~mol} \mathrm{dm}^{-3}$ aqueous sodium hydroxide to a conical flask.
- This aqueous sodium hydroxide is titrated with the acid solution.

The titration results are shown in the table.

|  | Rough | $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{3}$ |
| :--- | :---: | :---: | :---: | :---: |
| Final volume $/ \mathbf{c m}^{3}$ | 27.35 | 26.75 | 38.90 | 35.70 |
| Initial volume $/ \mathbf{c m}^{\mathbf{3}}$ | 0.00 | 0.35 | 12.15 | 9.20 |
| Titre $/ \mathbf{c m}^{3}$ | 27.35 | 26.40 | 26.75 | 26.50 |

(a) Use the results to calculate the $M_{r}$ of $\mathrm{H}_{2} \mathrm{~A}$
$M_{r}$ of $\mathrm{H}_{2} \mathrm{~A}$ $\qquad$
(b) The uncertainty in using the pipette in this experiment is $\pm 0.06 \mathrm{~cm}^{3}$

Calculate the percentage uncertainty in using the pipette.

> \% uncertainty
$\qquad$
(c) Before adding the solution from the burette in the rough titration, there was an air bubble below the tap.
At the end of this titration the air bubble was not there.
Explain why this air bubble increases the final burette reading of the rough titration.
$\qquad$
$\qquad$
$\qquad$
(d) During the titration the student washed the inside of the conical flask with some distilled water.

Suggest why this washing does not give an incorrect result.
$\qquad$
$\qquad$
6. This question is about the reactions of magnesium and its compounds.
(a) Magnesium is used in one of the stages in the extraction of titanium.

Give an equation for the reaction between titanium(IV) chloride and magnesium. State the role of magnesium in this reaction.

Equation

Role of magnesium $\qquad$
(b) A mixture of magnesium oxide and magnesium hydroxide has a mass of 3200 mg

This mixture is reacted with carbon dioxide to form magnesium carbonate and water. The mass of water produced is 210 mg

$$
\begin{gathered}
\mathrm{Mg}(\mathrm{OH})_{2}+\mathrm{CO}_{2} \rightarrow \mathrm{MgCO}_{3}+\mathrm{H}_{2} \mathrm{O} \\
\mathrm{MgO}+\mathrm{CO}_{2} \rightarrow \mathrm{MgCO}_{3}
\end{gathered}
$$

Calculate the percentage by mass of magnesium oxide in this mixture.
\% of magnesium oxide $\qquad$
7. A student does an experiment to determine the percentage of copper in an alloy.

The student

- reacts 985 mg of the alloy with concentrated nitric acid to form a solution (all of the copper in the alloy reacts to form aqueous copper(II) ions)
- pours the solution into a volumetric flask and makes the volume up to $250 \mathrm{~cm}^{3}$ with distilled water
- shakes the flask thoroughly
- transfers $25.0 \mathrm{~cm}^{3}$ of the solution into a conical flask and adds an excess of potassium iodide
- uses exactly $9.00 \mathrm{~cm}^{3}$ of $0.0800 \mathrm{~mol} \mathrm{dm}{ }^{-3}$ sodium thiosulfate $\left(\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}\right)$ solution to react with all the iodine produced.

The equations for the reactions are

$$
\begin{gathered}
2 \mathrm{Cu}^{2+}+4 \mathrm{I}^{-} \rightarrow 2 \mathrm{CuI}+\mathrm{I}_{2} \\
2 \mathrm{~S}_{2} \mathrm{O}_{3}{ }^{2-}+\mathrm{I}_{2} \rightarrow 2 \mathrm{I}^{-}+\mathrm{S}_{4} \mathrm{O}_{6}{ }^{2-}
\end{gathered}
$$

(a) Calculate the percentage of copper by mass in the alloy.

Give your answer to the appropriate number of significant figures.
$\qquad$
(b) Suggest two ways that the student could reduce the percentage uncertainty in the measurement of the volume of sodium thiosulfate solution, using the same apparatus as this experiment.

1 $\qquad$
$\qquad$

2 $\qquad$
$\qquad$
3 $\qquad$
$\qquad$
(c) State the role of iodine in the reaction with sodium thiosulfate.
$\qquad$
(d) Give the full electron configuration of a copper(II) ion.
$\qquad$
(e) Copper(I) iodide is a white solid.

Explain why copper $(\mathrm{I})$ iodide is white.
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
(f) lodine vaporises easily.

Calculate the volume, in $\mathrm{cm}^{3}$, that 5.00 g of iodine vapour occupies at $185^{\circ} \mathrm{C}$ and 100 kPa
The gas constant $R=8.31 \mathrm{~J} \mathrm{~K}^{-1} \mathrm{~mol}^{-1}$
Give your answer to 3 significant figures.

$$
\text { Volume } \quad \mathrm{cm}^{3}
$$
