

Q1. Oxygen and ozone (O₃) both occur as gases in the upper atmosphere. Chlorine atoms catalyse the decomposition of ozone and contribute to the formation of a hole in the ozone layer. These chlorine atoms are formed from chlorofluorocarbons (CFCs) such as CF₃Cl

(a) (i) Give the IUPAC name of CF₃Cl

.....

(1)

(ii) Complete the following equation that shows the formation of a chlorine atom from a molecule of CF₃Cl

(1)

(iii) State what the • represents in Cl•

.....

(1)

(b) Write two equations that show how chlorine atoms catalyse the decomposition of ozone into oxygen.

Equation 1

Equation 2

(2)

(c) An equilibrium is established between oxygen and ozone molecules as shown below.

(i) State Le Chatelier's principle.

.....

.....

.....

(1)

- (ii) Use Le Chatelier's principle to explain how an increase in temperature causes an increase in the equilibrium yield of ozone.

.....

.....

.....

.....

(2)

- (d) Chemists supported the legislation to ban the use of CFCs. Modern refrigerators use pentane rather than CFCs as refrigerants. With reference to its formula, state why pentane is a more environmentally acceptable refrigerant.

.....

- Q2.** One of the first substances used as an anaesthetic in medicine was chloroform (trichloromethane, CHCl_3). By 1950, *halothane* was in common use but by 1990 this had been replaced by more acceptable anaesthetics such as *desflurane*.

One reason for replacing *halothane* was that it is an organic compound that contains chlorine. Chlorine-containing organic compounds are thought to cause damage to the ozone layer in the upper atmosphere.

- (a) Name and outline a mechanism for the reaction of chlorine with methane to form chloromethane (CH_3Cl).

Write an overall equation for the reaction of chlorine with methane to form trichloromethane (CHCl_3).

(b) Explain how chlorine atoms are formed from chlorine-containing organic compounds in the upper atmosphere.

Explain, with the aid of equations, how chlorine atoms act as a catalyst in the decomposition of ozone into oxygen.

(c) Use the formulae of the two anaesthetics, *halothane* and *desflurane*, to help to explain why *desflurane* is considered to be a more **environmentally** acceptable anaesthetic than *halothane*.
